

Collaborative AI helps employees work faster and learn while they work

When people learn to direct, question, and apply AI output, the gains can improve both speed and quality.

In a preregistered experiment, 453 college-educated professionals completed incentivized writing tasks with or without ChatGPT. AI-assisted participants took 40% less time, while independent raters scored their work 18% higher in quality.

- **The result**

AI cut task time and improved assessed quality in the experiment.
- **The boundary**

The evidence covers writing tasks, not every job or workflow.
- **Employee role**

Employees still frame, inspect, and own the decision.

The employee takeaway

Training helps employees use AI for speed and quality without giving up review, judgment, or accountability.

Managers turn employee-level gains into team performance and business value

Managers decide whether those gains stay isolated or become repeatable team capability.

In a field study of 5,179 customer-support agents, access to an AI conversational assistant increased issues resolved per hour by 14% on average and by 34% for novice and low-skilled workers. The authors found suggestive evidence that the system spread practices from more experienced workers.

● Productivity	The average gain improved issues resolved per hour.
● Performance	Novice workers showed the largest gain, suggesting faster learning of effective patterns.
● Business value	McKinsey respondents reported cost and revenue gains in gen AI business units. This is self-reported, not causal evidence.

The employer takeaway

Proper training is the bridge from individual task help to repeatable productivity, stronger performance, and reported business value.
